In the previous chapter, we have studied about matrices and algebra of matrices. We have also learnt that a system of algebraic equations can be expressed in the form of matrices. This means, a system of linear equations like

*

$$a_1 x + b_1 y = c_1$$

$$a_2 x + b_2 y = c_2$$

$$\begin{bmatrix} a_1 & b_1 \end{bmatrix} \begin{bmatrix} x \end{bmatrix} \begin{bmatrix} c \end{bmatrix}$$

can be represented as $\begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} c_1 \\ c_2 \end{bmatrix}$ Now, this

system of equations has a unique solution or not, is determined by the number $a_1 b_2 - a_2 b_1$. (Recall that if

 $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$ or, $a_1 b_2 - a_2 b_1 \neq 0$, then the system of linear equations has a unique solution). The number $a_1 b_2 - a_2 b_1$

P.S. Laplace (1749-1827)

which determines uniqueness of solution is associated with the matrix $A = \begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix}$

and is called the determinant of A or det A. Determinants have wide applications in Engineering, Science, Economics, Social Science, etc.

In this chapter, we shall study determinants up to order three only with real entries. Also, we will study various properties of determinants, minors, cofactors and applications of determinants in finding the area of a triangle, adjoint and inverse of a square matrix, consistency and inconsistency of system of linear equations and solution of linear equations in two or three variables using inverse of a matrix.

To every square matrix $A = [a_{ij}]$ of order n, we can associate a number (real or complex) called determinant of the square matrix A, where $a_{ij} = (i, j)^{th}$ element of A.

This may be thought of as a function which associates each square matrix with a strong through the set of square matrices, K is the This may be thought of as a function which associated as a function which associated with with a set of square matrices, K is the set of unique number (real or complex). If M is the set of square matrices, K is the set of unique number (real or complex). If M is defined by f(A) = k, where $A \in M$ unique number (real or complex). If M is the set of A where $A \in M$ and A is defined by A or det A in also denoted by A or det Anumbers (real or complex) and $f: \mathbb{N} \to \mathbb{K}$ is defined by A or A or A or A or A is called the determinant of A. It is also denoted by A or A or A

- (i) For matrix A, |A| is read as determinant of A and not modulus of A.
- (ii) Only square matrices have determinants.

4.2.1 Determinant of a matrix of order one

Let A = [a] be the matrix of order 1, then determinant of A is defined to be equal t_{0q}

4.2.2 Determinant of a matrix of order two

 $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ be a matrix of order 2 × 2, Let

then the determinant of A is defined as:

det (A) = |A| =
$$\Delta = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{21}a_{12}$$

Evaluate
$$\begin{vmatrix} 2 & 4 \\ -1 & 2 \end{vmatrix}$$
.

We have
$$\begin{vmatrix} 2 & 4 \\ -1 & 2 \end{vmatrix} = 2(2) - 4(-1) = 4 + 4 = 8$$
.

Evaluate
$$\begin{vmatrix} x & x+1 \\ x-1 & x \end{vmatrix}$$

We have

$$\begin{vmatrix} x & x+1 \\ x-1 & x \end{vmatrix} = x(x) - (x+1)(x-1) = x^2 - (x^2-1) = x^2 - x^2 + 1 = 1$$

4.2.3 Pederminant of a matrix of order 3 x 3

Determinant of a matrix of order three can be determined by expressing it in terms of second order determinants. This is known as expansion of a determinant along a row (or a column). There are six ways of expanding a determinant of order

3 correspo C3) giving

i.e.,

Expai

secor colui

i.e.,

or

of

3 corresponding to each of three rows (R₁, R₂ and R₃) and three columns (C₁, C₂ and 3 contest the same value as shown below.

Consider the determinant of square matrix $A = [a_{ij}]_{3 \times 3}$

$$|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Expansion along first Row (R1)

atrix with

is the se

det A or

qual to

i.e..

i.e.,

Multiply first element a_{11} of R_1 by $(-1)^{(1+1)}$ [$(-1)^{\text{sum of suffixes in } a_{11}}$] and with the second order determinant obtained by deleting the elements of first row (R₁) and first column (C_1) of |A| as a_{11} lies in R_1 and C_1 ,

i.e.,
$$(-1)^{1+1} a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}$$

Multiply 2nd element a_{12} of R_1 by $(-1)^{1+2}$ [$(-1)^{\text{sum of suffixes in } a_{12}}$] and the second order determinant obtained by deleting elements of first row (R₁) and 2nd column (C₂) of |A| as a_{12} lies in R_1 and C_2 ,

i.e.,
$$(-1)^{1+2} a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$$

Multiply third element a_{13} of R_1 by $(-1)^{1+3}$ [$(-1)^{\text{sum of suffixes in } a_{13}}$] and the second order determinant obtained by deleting elements of first row (R₁) and third column (C₃) of |A| as a_{13} lies in R_1 and C_3 ,

$$(-1)^{1+3} a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

Now the expansion of determinant of A, that is, | A | written as sum of all three terms obtained in steps 1, 2 and 3 above is given by

det A = |A| =
$$(-1)^{1+1} a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} + (-1)^{1+2} a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$$

+ $(-1)^{1+3} a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$
|A| = $a_{11} (a_{22} a_{33} - a_{32} a_{23}) - a_{12} (a_{21} a_{33} - a_{31} a_{23})$
+ $a_{13} (a_{21} a_{32} - a_{31} a_{22})$

$$= a_{11} a_{22} a_{33} - a_{11} a_{32} a_{23} - a_{12} a_{21} a_{33} + a_{12} a_{31} a_{23} + a_{13} a_{21} a_{32} - a_{13} a_{31} a_{22}$$
 ... (1)

squar

|B|,

Ex

We shall apply all four steps together.

Expansion along second row (R2)

$$|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Expanding along R,, we get

$$|A| = (-1)^{2+1} a_{21} \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix} + (-1)^{2+2} a_{22} \begin{vmatrix} a_{11} & a_{13} \\ a_{31} & a_{33} \end{vmatrix}$$

$$+ (-1)^{2+3} a_{23} \begin{vmatrix} a_{11} & a_{12} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= -a_{21} (a_{12} a_{33} - a_{32} a_{13}) + a_{22} (a_{11} a_{33} - a_{21} a_{13})$$

$$- a_{23} (a_{11} a_{32} - a_{31} a_{12})$$

$$|A| = -a_{21} a_{12} a_{33} + a_{21} a_{32} a_{13} + a_{22} a_{11} a_{33} - a_{22} a_{31} a_{13} - a_{23} a_{11} a_{32}$$

$$+ a_{23} a_{31} a_{12}$$

$$= a_{11} a_{22} a_{33} - a_{11} a_{23} a_{32} - a_{12} a_{21} a_{33} + a_{12} a_{23} a_{31} + a_{13} a_{21} a_{32}$$

$$- a_{13} a_{31} a_{22}$$

Expansion along first Column (C1)

$$|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

By expanding along C₁, we get

$$|A| = a_{11} (-1)^{1+1} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} + a_{21} (-1)^{2+1} \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix}$$

$$+ a_{31} (-1)^{3+1} \begin{vmatrix} a_{12} & a_{13} \\ a_{22} & a_{23} \end{vmatrix}$$

$$= a_{11} (a_{22} a_{33} - a_{23} a_{32}) - a_{21} (a_{12} a_{33} - a_{13} a_{32}) + a_{31} (a_{12} a_{23} - a_{13} a_{22})$$

$$|A| = a_{11} a_{22} a_{33} - a_{11} a_{23} a_{32} - a_{21} a_{12} a_{33} + a_{21} a_{18} a_{32} + a_{41} a_{18} a_{23} - a_{21} a_{18} a_{22} = a_{11} a_{22} a_{33} - a_{11} a_{23} a_{32} - a_{12} a_{21} a_{33} + a_{12} a_{23} a_{31} + a_{13} a_{21} a_{43} - a_{13} a_{21} a_{22} = a_{13} a_{31} a_{22} a_{33} - a_{11} a_{23} a_{32} - a_{12} a_{21} a_{33} + a_{12} a_{23} a_{31} + a_{13} a_{21} a_{43} - a_{13} a_{22}$$
... (3)

Clearly, values of |A| in (1), (2) and (3) are equal. It is left as an exercise to the reader to verify that the values of |A| by expanding along R_3 , C_2 and C_3 are equal to the value of |A| obtained in (1), (2) or (3).

Hence, expanding a determinant along any row or column gives same value.

- For easier calculations, we shall expand the determinant along that row or column which contains maximum number of zeros.
- While expanding, instead of multiplying by $(-1)^{i+j}$, we can multiply by +1 or -1 according as (i+j) is even or odd.

Let
$$A = \begin{bmatrix} 2 & 2 \\ 4 & 0 \end{bmatrix}$$
 and $B = \begin{bmatrix} 1 & 1 \\ 2 & 0 \end{bmatrix}$. Then, it is easy to verify that $A = 2B$. Also $|A| = 0 - 8 = -8$ and $|B| = 0 - 2 = -2$.

Observe that, $|A| = 4(-2) = 2^2 |B|$ or $|A| = 2^n |B|$, where h = 2 is the order of square matrices A and B.

In general, if A = kB where A and B are square matrices of order n, then $|A| = k^n$ | B|, where n = 1, 2, 3

Example 3Evaluate the determinant
$$\Delta = \begin{bmatrix} 1 & 2 & 4 \\ -1 & 3 & 0 \\ 4 & 1 & 0 \end{bmatrix}$$
.

SolutionNote that in the third column, two entries are zero. So expanding along third column (C₃), we get

$$\Delta = 4 \begin{vmatrix} -1 & 3 \\ 4 & 1 \end{vmatrix} - 0 \begin{vmatrix} 1 & 2 \\ 4 & 1 \end{vmatrix} + 0 \begin{vmatrix} 1 & 2 \\ -1 & 3 \end{vmatrix}$$
$$= 4 (-1 - 12) - 0 + 0 = -52$$

Example 4Evaluate
$$\Delta = \begin{vmatrix} 0 & \sin \alpha & -\cos \alpha \\ -\sin \alpha & 0 & \sin \beta \\ \cos \alpha & -\sin \beta & 0 \end{vmatrix}$$

MATHEMATICS

Expanding along R₁, we get

Expanding along
$$R_1$$
, we get
$$\Delta = 0 \begin{vmatrix} 0 & \sin \beta \\ -\sin \beta & 0 \end{vmatrix} - \sin \alpha \begin{vmatrix} -\sin \alpha & \sin \beta \\ \cos \alpha & 0 \end{vmatrix} - \cos \alpha \begin{vmatrix} -\sin \alpha \\ \cos \alpha & -\sin \beta \end{vmatrix}$$

$$= 0 \left| -\sin \beta = 0 \right| \cos \alpha$$

$$= 0 - \sin \alpha (0 - \sin \beta \cos \alpha) - \cos \alpha (\sin \alpha \sin \beta - 0)$$

$$= 0 - \sin \alpha (0 - \sin \beta \cos \alpha) - \cos \alpha (\sin \alpha \sin \beta - 0)$$

=
$$0 - \sin \alpha (0 - \sin \beta \cos \alpha)$$

= $\sin \alpha \sin \beta \cos \alpha - \cos \alpha \sin \alpha \sin \beta = 0$

Find values of x for which
$$\begin{vmatrix} 3 & x \\ x & 1 \end{vmatrix} = \begin{vmatrix} 3 & 2 \\ 4 & 1 \end{vmatrix}$$
.

Supplied We have
$$\begin{vmatrix} 3 & x \\ x & 1 \end{vmatrix} = \begin{vmatrix} 3 & 2 \\ 4 & 1 \end{vmatrix}$$

i.e.
$$3 - x^2 = 3 - 8$$

i.e.
$$x^2 = 8$$

Hence
$$x = \pm 2\sqrt{2}$$

EXERCISE 4.1

Evaluate the determinants in Exercises 1 and 2. 15 mos had 2004

(i)
$$\begin{vmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{vmatrix}$$

(ii)
$$\begin{vmatrix} x^2 - x + 1 & x - 1 \\ x + 1 & x + 1 \end{vmatrix}$$

If
$$A = \begin{bmatrix} 1 & 2 \\ 4 & 2 \end{bmatrix}$$
, then show that $|2A| = 4 |A|$

If
$$A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix}$$
, then show that $|3A| = 27 |A|$

Evaluate the determinants

Where x is equal to

(A) 6 (B) ± 6 (C) -6 (D) 0

In the previous section, we have learnt how to expand the determinants. In this section, we will study some properties of determinants which simplifies its evaluation by obtaining maximum number of zeros in a row or a column. These properties are true for determinants of any order. However, we shall restrict ourselves upto determinants of order 3 only.

The value of the determinant remains unchanged if its rows and columns are interchanged.

Verification Let
$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Expanding along first row, we get

$$\Delta = a_1 \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$

$$= a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_3)$$

$$= a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_3)$$

$$= a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_3)$$

By interchanging the rows and columns of Δ , we get the determinant

$$\Delta = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{bmatrix}$$

Expanding Δ_i along first column, we get

$$\Delta_1 = a_1 (b_2 c_3 - c_2 b_3) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_1)$$

Hence $\Delta = \Delta_1$

It follows from above property that if A is a square matrix, then $\det(A) = \det(A')$, where $A' = \operatorname{transpose}$ of A.

If $R_i = i$ th row and $C_i = i$ th column, then for interchange of row and columns, we will symbolically write $C_i \leftrightarrow R_i$

Let us verify the above property by example.

Verify Property 1 for
$$\Delta = \begin{vmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{vmatrix}$$

Expanding the determinant along first row, we have

$$\Delta = 2 \begin{vmatrix} 0 & 4 \\ 5 & -7 \end{vmatrix} - (-3) \begin{vmatrix} 6 & 4 \\ 1 & -7 \end{vmatrix} + 5 \begin{vmatrix} 6 & 0 \\ 1 & 5 \end{vmatrix}$$
$$= 2 (0 - 20) + 3 (-42 - 4) + 5 (30 - 0)$$
$$= -40 - 138 + 150 = -28$$

By interchanging rows and columns, we get

$$\Delta_{1} = \begin{vmatrix} 2 & 6 & 1 \\ -3 & 0 & 5 \\ 5 & 4 & -7 \end{vmatrix}$$
 (Expanding along first column)

$$= 2 \begin{vmatrix} 0 & 5 \\ 4 & -7 \end{vmatrix} - (-3) \begin{vmatrix} 6 & 1 \\ 4 & -7 \end{vmatrix} + 5 \begin{vmatrix} 6 & 1 \\ 0 & 5 \end{vmatrix}$$

$$= 2 (0 - 20) + 3 (-42 - 4) + 5 (30 - 0)$$

$$= -40 - 138 + 150 = -28$$

Clearly $\Delta = \Delta_1$

Hence, Property 1 is verified.

If any two rows (or columns) of a determinant are interchanged, then sign

Verification Let
$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Expanding along first row, we get

$$\Delta = a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_1)$$

Interchanging first and third rows, the new determinant obtained is given by

$$\Delta_{1} = \begin{vmatrix} c_{1} & c_{2} & c_{3} \\ b_{1} & b_{2} & b_{3} \\ a_{1} & a_{2} & a_{3} \end{vmatrix}$$

Expanding along third row, we get

$$\Delta_1 = a_1 (c_2 b_3 - b_2 c_3) - a_2 (c_1 b_3 - c_3 b_1) + a_3 (b_2 c_1 - b_1 c_2)$$

= - [a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_1)]

Clearly
$$\Delta_1 = -\Delta$$

· then

and

Similarly, we can verify the result by interchanging any two columns.

We can denote the interchange of rows by $R_i \leftrightarrow R_j$ and interchange of columns by $C_i \leftrightarrow C_j$.

Verify Property 2 for
$$\Delta = \begin{vmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{vmatrix}$$
.

$$\Delta = \begin{vmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{vmatrix} = -28 \text{ (See Example 6)}$$

Interchanging rows R_2 and R_3 i.e., $R_2 \leftrightarrow R_3$, we have

$$\Delta_1 = \begin{vmatrix} 2 & -3 & 5 \\ 1 & 5 & -7 \\ 6 & 0 & 4 \end{vmatrix}$$

Expanding the determinant Δ_1 along first row, we have

$$\Delta_1 = 2 \begin{vmatrix} 5 & -7 \\ 0 & 4 \end{vmatrix} - (-3) \begin{vmatrix} 1 & -7 \\ 6 & 4 \end{vmatrix} + 5 \begin{vmatrix} 1 & 5 \\ 6 & 0 \end{vmatrix}$$

$$= 2 (20 - 0) + 3 (4 + 42) + 5 (0 - 30)$$

$$= 40 + 138 - 150 = 28$$

Clearly

$$\Delta_1 = -\Delta$$

Hence, Property 2 is verified.

If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then value of determinant is zero.

If we interchange the identical rows (or columns) of the determinant Δ , then Δ does not change. However, by Property 2, it follows that Δ has changed its sign

Therefore

$$\Delta = -\Delta$$

or

$$\Delta = 0$$

Let us verify the above property by an example.

Evaluate
$$\Delta = \begin{vmatrix} 3 & 2 & 3 \\ 2 & 2 & 3 \\ 3 & 2 & 3 \end{vmatrix}$$

Expanding along first row, we get

$$\Delta = 3 (6 - 6) - 2 (6 - 9) + 3 (4 - 6)$$

$$= 0 - 2 (-3) + 3 (-2) = 6 - 6 = 0$$

Here R, and R, are identical.

If each element of a row (or a column) of a determinant is multiplied by a constant k, then its value gets multiplied by k.

Verification Let
$$\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

and Δ , be the determinant obtained by multiplying the elements of the first row by k. Then

$$\Delta_{1} = \begin{vmatrix} k a_{1} & k b_{1} & k c_{1} \\ a_{2} & b_{2} & c_{2} \\ a_{3} & b_{3} & c_{3} \end{vmatrix}$$

Expanding along first row, we get

$$\Delta_{1} = k \ a_{1} (b_{2} \ c_{3} - b_{3} \ c_{2}) - k \ b_{1} (a_{2} \ c_{3} - c_{2} \ a_{3}) + k \ c_{1} (a_{2} \ b_{3} - b_{2} \ a_{3})$$

$$= k \left[a_{1} (b_{2} \ c_{3} - b_{3} \ c_{2}) - b_{1} (a_{2} \ c_{3} - c_{2} \ a_{3}) + c_{1} (a_{2} \ b_{3} - b_{2} \ a_{3}) \right]$$

$$= k \Delta$$

Hence

$$\begin{vmatrix} k a_1 & k b_1 & k c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = k \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

- By this property, we can take out any common factor from any one row or any one column of a given determinant.
- If corresponding elements of any two rows (or columns) of a determinant are proportional (in the same ratio), then its value is zero. For example

$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ k a_1 & k a_2 & k a_3 \end{vmatrix} = 0 \text{ (rows R}_1 \text{ and R}_3 \text{ are proportional)}$$

Jew ony V

Note that
$$\begin{vmatrix} 102 & 18 & 36 \\ 1 & 3 & 4 \\ 17 & 3 & 6 \end{vmatrix} = \begin{vmatrix} 6(17) & 6(3) & 6(6) \\ 1 & 3 & 4 \\ 17 & 3 & 6 \end{vmatrix} = \begin{vmatrix} 17 & 3 & 6 \\ 1 & 3 & 4 \\ 17 & 3 & 6 \end{vmatrix} = 0$$

(Using Properties 3 and 4)

If some or all elements of a row or column of a determinant are expressed sum of two (or more) terms, then the determinant can be expressed as sum of two or more) determinants.

For example, $\begin{vmatrix} a_1 + \lambda_1 & a_2 + \lambda_2 & a_3 + \lambda_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} + \begin{vmatrix} \lambda_1 & \lambda_2 & \lambda_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$

crification L.H.S. =
$$\begin{vmatrix} a_1 + \lambda_1 & a_2 + \lambda_2 & a_3 + \lambda_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Expanding the determinants along the first row, we get

The determinants along the first row, we get
$$\Delta = (a_1 + \lambda_1) (b_2 c_3 - c_2 b_3) - (a_2 + \lambda_2) (b_1 c_3 - b_3 c_1)$$

$$+ (a_3 + \lambda_3) (b_1 c_2 - b_2 c_1)$$

$$= a_1 (b_2 c_3 - c_2 b_3) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_1)$$

$$+ \lambda_1 (b_2 c_3 - c_2 b_3) - \lambda_2 (b_1 c_3 - b_3 c_1) + \lambda_3 (b_1 c_2 - b_2 c_1)$$
(by rearranging terms)

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} + \begin{vmatrix} \lambda_1 & \lambda_2 & \lambda_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = R.H.S.$$

Similarly, we may verify Property 5 for other rows or columns.

Show that
$$\begin{vmatrix} a & b & c \\ a+2x & b+2y & c+2z \\ x & y & z \end{vmatrix} = 0$$

Solution We have
$$\begin{vmatrix} a & b & c \\ a+2x & b+2y & c+2z \\ x & y & z \end{vmatrix} = \begin{vmatrix} a & b & c \\ a & b & c \\ x & y & z \end{vmatrix} + \begin{vmatrix} a & b & c \\ 2x & 2y & 2z \\ x & y & z \end{vmatrix}$$

(by Property 5)

$$= 0 + 0 = 0$$

(Using Property 3 and Property 4)

Property 6 If, to each element of any row or column of a determinant, the equimultiples of corresponding elements of other row (or column) are added, then value of determinant remains the same, i.e., the value of determinant remain same if we apply the operation $R_i \rightarrow R_i + kR_j \text{ or } C_i \rightarrow C_i + kC_i$.

Verification

Let
$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \text{ and } \Delta_1 = \begin{vmatrix} a_1 + k c_1 & a_2 + k c_2 & a_3 + k c_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_2 \end{vmatrix},$$

where Δ_1 is obtained by the operation $R_1 \to R_1 + kR_3$.

Here, we have multiplied the elements of the third row (R_3) by a constant k and ed them to the corresponding elements of the third row (R_3) by a constant kadded them to the corresponding elements of the first row (R₁). Symbolically, we write this operation as $R_1 \rightarrow R_1 + k R_2$

115

Now, again

$$\Delta_{1} = \begin{vmatrix} a_{1} & a_{2} & a_{3} \\ b_{1} & b_{2} & b_{3} \\ c_{1} & c_{2} & c_{3} \end{vmatrix} + \begin{vmatrix} k c_{1} & k c_{2} & k c_{3} \\ b_{1} & b_{2} & b_{3} \\ c_{1} & c_{2} & c_{3} \end{vmatrix}$$
 (Using Property 5)

$$=\Delta+0$$

(since R₁ and R₃ are proportional)

 $\Delta = \Delta_1$ Hence .

Remarks

ng tem

perty 5

perty 4

ultiple minan

- (i) If Δ_i is the determinant obtained by applying $R_i \to kR_i$ or $C_i \to kC_i$ to the determinant Δ , then $\Delta_1 = k\Delta$.
- If more than one operation like $R_i \rightarrow R_i + kR_j$ is done in one step, care should be taken to see that a row that is affected in one operation should not be used in another operation. A similar remark applies to column operations.

Example 11 Prove that
$$\begin{vmatrix} a & a+b & a+b+c \\ 2a & 3a+2b & 4a+3b+2c \\ 3a & 6a+3b & 10a+6b+3c \end{vmatrix} = a^3$$

Solution Applying operations $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 = 3R_1$ to the given determinant Δ , we have

$$\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 0 & a & 2a+b \\ 0 & 3a & 7a+3b \end{vmatrix}$$

Now applying $R_3 \rightarrow R_3 - 3R_2$, we get

$$\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 0 & a & 2a+b \\ 0 & 0 & a \end{vmatrix}$$

xpanding along C, we obtain

$$\Delta = a \begin{vmatrix} a & 2a+b \\ 0 & a \end{vmatrix} + 0 + 0$$

$$= a (a^2 - 0) = a (a^2) = a^3$$

Example 12 Without expanding, prove that

$$\Delta = \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ 1 & 1 & 1 \end{vmatrix} = 0$$

Solution Applying $R_1 \rightarrow R_1 + R_2$ to Δ , we get

oplying
$$R_1 \rightarrow R_1 + R_2$$
 to Z ,
$$\Delta = \begin{vmatrix} x + y + z & x + y + z & x + y + z \\ z & x & y \\ 1 & 1 & 1 \end{vmatrix}$$

Since the elements of R_1 and R_3 are proportional, $\Delta = 0$.

Evaluate

$$\Delta = \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} 1 & a & bc \\ 0 & b - a & c(a - b) \\ 0 & c - a & b(a - c) \end{vmatrix}$$

Taking factors (b-a) and (c-a) common from R_2 and R_3 , respectively, we get

$$\Delta = (b - a) (c - a) \begin{vmatrix} 1 & a & bc \\ 0 & 1 & -c \\ 0 & 1 & -b \end{vmatrix}$$

= (b-a)(c-a)[(-b+c)] (Expanding along first column)

$$= (b-a) (c-a) [(-b+c)]$$
 (Expanding)
$$= (a-b) (b-c) (c-a)$$
Prove that
$$\begin{vmatrix} b+c & a & a \\ b & c+a & b \\ c & c & a+b \end{vmatrix} = 4abc$$

Let
$$\Delta = \begin{vmatrix} b+c & a & a \\ b & c+a & b \end{vmatrix}$$

Applying
$$R_1 \rightarrow R_1 - R_2 - R_3$$
 to Δ , we get
$$\Delta = \begin{vmatrix} 0 & -2c & -2b \\ b & c + a & b \\ c & c & a + b \end{vmatrix}$$

Expanding along R₁, we obtain

$$\Delta = 0 \begin{vmatrix} c+a & b \\ c & a+b \end{vmatrix} - (-2c) \begin{vmatrix} b & b \\ c & a+b \end{vmatrix} + (-2b) \begin{vmatrix} b & c+a \\ c & c \end{vmatrix}$$

$$= 2c (ab + b^2 - bc) - 2b (bc - c^2 - ac)$$

$$= 2abc + 2cb^2 - 2bc^2 - 2b^2c + 2bc^2 + 2abc$$

$$= 4abc$$

If x, y, z are different and $\Delta = |y| y^2 + |y| = 0$, then

show that 1 + xyz = 0

We have

$$\Delta = \begin{vmatrix} x & x^2 & 1 + x^3 \\ y & y^2 & 1 + y^3 \\ z & z^2 & 1 + z^3 \end{vmatrix}$$

e get

$$\begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + \begin{vmatrix} x & x^2 & x^3 \\ y & y^2 & y^3 \\ z & z^2 & z^3 \end{vmatrix}$$
 (Using Property 5)

$$= (-1)^{2} \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix} + xyz \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix}$$
 (Using $C_{3} \leftrightarrow C_{2}$ and then $C_{1} \leftrightarrow C_{2}$)

$$= \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} (1 + xyz)$$

$$= (1+xyz)\begin{vmatrix} 1 & x & x^2 \\ 0 & y-x & y^2-x^2 \\ 0 & z-x & z^2-x^2 \end{vmatrix}$$
 (Using $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$)

Taking out common factor (y - x) from R_2 and (z - x) from R_3 , we get

$$\Delta = (1+xyz) (y-x) (z-x) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1 & y+x \\ 0 & 1 & z+x \end{vmatrix}$$

=
$$(1 + xyz) (y - x) (z - x) (z - y)$$
 (on expanding along C_1)

Since $\Delta = 0$ and x, y, z are all different, i.e., $x - y \neq 0$, $y - z \neq 0$, $z - x \neq 0$, we get 1 + xyz = 0

Example 16 Show that

$$\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1+c \end{vmatrix} = abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) = abc + bc + ca + ab$$

Solution Taking out factors a,b,c common from R_1 , R_2 and R_3 , we get

L.H.S. =
$$abc\begin{vmatrix} \frac{1}{a} + 1 & \frac{1}{a} & \frac{1}{a} \\ \frac{1}{b} & \frac{1}{b} + 1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c} + 1 \end{vmatrix}$$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$, we have

$$\Delta = abc \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \\ \frac{1}{b} & \frac{1}{b} + 1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c} + 1 \end{vmatrix}$$

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) \begin{vmatrix} 1 & 1 & 1 \\ \frac{1}{b} & \frac{1}{b} + 1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c} + 1 \end{vmatrix}$$
Now applying $C_2 \rightarrow C_2 - C_1$, $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} 1 & 0 & 0 \\ \frac{1}{b} & 1 & 0 \\ \frac{1}{c} & 0 & 1 \end{vmatrix}$$

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \left[1(1-0) \right]$$

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) = abc + bc + ca + ab = \text{R.H.S.}$$

Alternately try by applying $C_1 \rightarrow C_1 - C_2$ and $C_3 \rightarrow C_3 - C_2$; then apply $C_1 \rightarrow C_1 - a C_3$.

(i)
$$\begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = (a-b)(b-c)(c-a)$$

8.
$$\begin{vmatrix} 1 & c & c^2 \end{vmatrix}$$

(ii) $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^3 & b^3 & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(a+b+c)$

$$\begin{vmatrix} x & x^2 & yz \\ y & y^2 & zx \\ z & z^2 & xy \end{vmatrix} = (x - y) (y - z) (z - x) (xy + yz + zx)$$

10. (i)
$$\begin{vmatrix} x+4 & 2x & 2x \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix} = (5x+4)(4-x)^2$$

(ii)
$$\begin{vmatrix} y+k & y & y \\ y & y+k & y \\ y & y & y+k \end{vmatrix} = k^2 (3y+k)$$

11. (i)
$$\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = (a+b+c)^3$$

(ii)
$$\begin{vmatrix} x+y+2z & x & y \\ z & y+z+2x & y \\ x & z+x+2y \end{vmatrix} = 2(x+y+z)^3$$
Scanned

$$\begin{vmatrix} 1 & x & x^{2} \\ x^{2} & 1 & x \\ x & x^{2} & 1 \end{vmatrix} = (1 - x^{3})^{2}$$

$$\begin{vmatrix} 1 & x & x^{2} \\ x^{2} & 1 & x \\ x & x^{2} & 1 \end{vmatrix} = (1 - x^{3})^{2}$$

$$\begin{vmatrix} 1 & x & x^{2} \\ x^{2} & 1 & x \\ x & x^{2} & 1 \end{vmatrix} = 2ab$$

$$\begin{vmatrix} 1 & x & x^{2} \\ 2 & 1 & 1 \\ 2 & 1 & 1 \end{vmatrix}$$

12.
$$\begin{vmatrix} x & x^2 & 1 \end{vmatrix}$$

 $\begin{vmatrix} 1+a^2-b^2 & 2ab & -2b \\ 2ab & 1-a^2+b^2 & 2a \\ 2b & -2a & 1-a^2-b^2 \end{vmatrix} = (1+a^2+b^2)^3$

$$= (1+a^2+b^2)^3$$

$$\begin{vmatrix} a^{2}+1 & ab & ac \\ ab & b^{2}+1 & bc \\ ca & cb & c^{2}+1 \end{vmatrix} = 1 + a^{2} + b^{2} + c^{2}$$

$$R_1 \rightarrow R_1 + bR_3$$
 $R_2 \rightarrow R_2 - aR_3$

Choose the correct answer in Exercises 15 and 16.

Let A be a square matrix of order 3×3 , then |kA| is equal to

15. (A) k|A| (B) $k^2|A|$

 (\mathcal{L}) $k^3 |A|$

(D) 3k |A|

Which of the following is correct

27X3

- (A) Determinant is a square matrix.
 - (B) Determinant is a number associated to a matrix.
 - (C) Determinant is a number associated to a square matrix.
 - (D) None of these

4.4 Area of a Triangle In earlier classes, we have studied that the area of a triangle whose vertices are

 $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3) , is given by the expression $\frac{1}{2}[x_1(y_2-y_3) + x_2(y_3-y_1) +$

 $x_3(y_1-y_2)$]. Now this expression can be written in the form of a determinant as

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Remarks area is a positive quantity, we always take the absolute value of the determinant in (1).

- If area is given, use both positive and negative values of the determinant for
- The area of the triangle formed by three collinear points is zero. **Example 17** Find the area of the triangle whose vertices are (3, 8). (-4, 2) and (5, 1)

Solution The area of triangle is given by

e area of triangle is given by
$$\Delta = \frac{1}{2} \begin{vmatrix} 3 & 8 & 1 \\ -4 & 2 & 1 \\ 5 & 1 & 1 \end{vmatrix}$$

$$= \frac{1}{2} [3(2-1)-8(-4-5)+1(-4-10)]$$

$$= \frac{1}{2} (3+72-14) = \frac{61}{2}$$

Example 18 Find the equation of the line joining A(1, 3) and B (0, 0) using determinants and find k if D(k, 0) is a point such that area of triangle ABD is 3sq units.

Solution Let P(x, y) be any point on AB. Then, area of triangle ABP is zero (Why?). S_0

$$\frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ 1 & 3 & 1 \\ x & y & 1 \end{vmatrix} = 0$$

$$\frac{1}{2} (y - 3x) = 0 \text{ or } y = 3x,$$

This gives

which is the equation of required line AB.

Also, since the area of the triangle ABD is 3 sq. units, we have

$$\frac{1}{2} \begin{vmatrix} 1 & 3 & 1 \\ 0 & 0 & 1 \\ k & 0 & 1 \end{vmatrix} = \pm 3$$

This gives,
$$\frac{-3k}{2} = \pm 3$$
, i.e., $k = \mp 2$.

- (Ges of not mosted) Find area of the triangle with vertices at the point given in each of the following:
 - (i) (1,0), (6,0), (4,3)

(ii) (2, 7), (1, 1), (10, 8)

Show that points

A (a, b + c), B (b, c + a), C (c, a + b) are collinear.

3. Find values of k if area of triangle is 4-sq. units and vertices are

(i) (k, 0), (4, 0), (0, 2)

(-2,0),(0,4),(0,k)

- 4. (i) Find equation of line joining (1, 2) and (3, 6) using determinants.
 - (ii) Find equation of line joining (3, 1) and (9, 3) using determinants.
- 5. If area of triangle is 35 sq units with vertices (2, -6), (5, 4) and (k, 4). Then k is

(A) 12

(B) -2

(C) -12, -2

(D) 12, -2

4.5 Minors and Cofactors

In this section, we will learn to write the expansion of a determinant in compact form using minors and cofactors.

Definition 1 Minor of an element a_{ij} of a determinant is the determinant obtained by deleting its ith row and jth column in which element a_{ij} lies. Minor of an element a_{ij} is denoted by M_{ii}.

Remark Minor of an element of a determinant of order $n(n \ge 2)$ is a determinant of order n-1.

Example 19 Find the minor of element 6 in the determinant $\Delta = \begin{bmatrix} 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$

Solution Since 6 lies in the second row and third column, its minor M₂₃ is given by

$$M_{23} = \begin{vmatrix} 1 & 2 \\ 7 & 8 \end{vmatrix} = 8 - 14 = -6$$
 (obtained by deleting R_2 and C_3 in Δ).

Definition 2 Cofactor of an element a_{ij} , denoted by A_{ij} is defined by $A_{ij} = (-1)^{i+j} M_{ij}$, where M_{ij} is minor of a_{ij} .

Example 20 Find minors and cofactors of all the elements of the determinant $\begin{vmatrix} 1 & -2 \\ 4 & 3 \end{vmatrix}$

Solution Minor of the element a_{ij} is M_{ij} Here $a_{11} = 1$. So $M_{11} = Minor of <math>a_{11} = 3$ M_{12} = Minor of the element a_{12} = 4. $M_{21} = Minor of the element <math>a_{21} = -2$

Monor of element and 1511 exert line to be written in paper

124 MATHEMATICS

 M_{22} = Minor of the element a_{22} = 1

Now, cofactor of a_{ij} is A_{ij} . So

$$A_{11} = (-1)^{1+1} M_{11} = (-1)^2 (3) = 3$$

$$A_{12} = (-1)^{1+2} M_{12} = (-1)^3 (4) = -4$$

$$A_{21} = (-1)^{2+1} M_{21} = (-1)^3 (-2) = 2$$

$$A_{22} = (-1)^{2+2} M_{22} = (-1)^4 (1) = 1$$

Find minors and cofactors of the elements a_{11} , a_{21} in the determinant

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

By definition of minors and cofactors, we have

Minor of
$$a_{11} = M_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} = a_{22} a_{33} - a_{23} a_{32}$$

Cofactor of
$$a_{11} = A_{11} = (-1)^{1+1} M_{11} = a_{22} a_{33} - a_{23} a_{32}$$

Minor of
$$a_{21} = M_{21} = \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix} = a_{12} a_{33} - a_{13} a_{32}$$

Cofactor of
$$a_{21} = A_{21} = (-1)^{2+1}$$
 $M_{21} = (-1) (a_{12} a_{33} - a_{13} a_{32}) = -a_{12} a_{33} + a_{13} a_{32}$

Expanding the determinant Δ , in Example 21, along R_1 , we have

$$\Delta = (-1)^{1+1} a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} + (-1)^{1+2} a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + (-1)^{1+3} a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= a_{11} A_{11} + a_{12} A_{12} + a_{13} A_{13}$$
, where A_{ij} is cofactor of a_{ij}

= sum of product of elements of R_i with their corresponding cofactors

Similarly, Δ can be calculated by other five ways of expansion that is along R_2 , R_3 , C_1 , C_2 and C_3 .

Hence $\Delta = \text{sum of the product of elements of any row (or column) with their$ corresponding cofactors.

DETERMINANTS 125

$$\Delta = a_{11} A_{21} + a_{12} A_{22} + a_{13} A_{23}$$

$$= a_{11} (-1)^{1+1} \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix} + a_{12} (-1)^{1+2} \begin{vmatrix} a_{11} & a_{13} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} (-1)^{1+3} \begin{vmatrix} a_{11} & a_{12} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{11} & a_{12} & a_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = 0 \text{ (since } R_1 \text{ and } R_2 \text{ are identical)}$$

Similarly, we can try for other rows and columns.

Find minors and cofactors of the elements of the determinant

Example
$$\begin{bmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{bmatrix}$$
 and verify that $a_{11} A_{31} + a_{12} A_{32} + a_{13} A_{33} = 0$

We have
$$M_{11} = \begin{vmatrix} 0 & 4 \\ 5 & -7 \end{vmatrix} = 0 - 20 = -20$$
; $A_{11} = (-1)^{1+1} (-20) = -20$

$$M_{12} = \begin{vmatrix} 6 & 4 \\ 1 & -7 \end{vmatrix} = -42 - 4 = -46;$$
 $A_{12} = (-1)^{1+2}(-46) = 46$

$$M_{13} = \begin{vmatrix} 6 & 0 \\ 1 & 5 \end{vmatrix} = 30 - 0 = 30;$$
 $A_{13} = (-1)^{1+3} (30) = 30$

$$M_{21} = \begin{vmatrix} -3 & 5 \\ 5 & -7 \end{vmatrix} = 21 - 25 = -4;$$
 $A_{21} = (-1)^{2+1}(-4) = 4$

$$M_{22} = \begin{vmatrix} 2 & 5 \\ 1 & -7 \end{vmatrix} = -14 - 5 = -19;$$
 $A_{22} = (-1)^{2+2}(-19) = -19$

$$M_{22} = \begin{vmatrix} 2 & -3 \\ 1 & 5 \end{vmatrix} = 10 + 3 = 13;$$
 $A_{23} = (-1)^{2+3} (13) = -13$

$$A_{11} = \frac{|-3|}{0} \frac{5!}{-1} = -12 - 0 = -12!$$
 $A_{11} = -12! = -12!$

tine to be usitten

MATHEMATICS 126

$$M_{32} = \begin{vmatrix} 2 & 5 \\ 6 & 4 \end{vmatrix} = 8 - 30 = -22;$$
 $A_{32} = (-1)^{3+2}(-22) = 22$

$$M_{32} = \begin{vmatrix} 6 & 4 \end{vmatrix}$$

and $M_{33} = \begin{vmatrix} 2 & -3 \\ 6 & 0 \end{vmatrix} = 0 + 18 = 18;$ $A_{33} = (-1)^{3/3} (18) = 18$

and
$$M_{33} = |6 \ 0|$$

Now $a_{11} = 2, a_{12} = -3, a_{13} = 5; A_{31} = -12, A_{32} = 22, A_{33} = 18$

So
$$a_{11} A_{31} + a_{12} A_{32} + a_{13} A_{33}$$

= 2 (-12) + (-3) (22) + 5 (18) = -24 - 66 + 90 = 0

$$\begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$
 (ii) $\begin{vmatrix} 1 & 0 & 4 \\ 3 & 5 & -1 \\ 0 & 1 & 2 \end{vmatrix}$

3. Using Cofactors of elements of second row, evaluate
$$\Delta = \begin{bmatrix} 2 & 0 & 1 \\ 1 & 2 & 3 \end{bmatrix}$$
.

1342 (See position or Mand do this 5)

1 x yz

Using Cofactors of elements of third column, evaluate $\Delta = \begin{pmatrix} 1 & y & zx \\ 1 & z & xy \end{pmatrix}$.

5. If
$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$
 and A_{ij} is Cofactors of a_{ij} , then value of Δ is given by

(A) $a_{11} A_{12} A_{13} A_{13}$

(A)
$$a_{11} A_{31} + a_{12} A_{32} + a_{13} A_{33}$$
 (B) $a_{11} A_{11} + a_{12} A_{21} + a_{13} A_{31}$ (C) $a_{21} A_{11} + a_{22} A_{12} + a_{23} A_{13}$ (D) $a_{11} A_{11} + a_{21} A_{21} + a_{31} A_{31}$

4.6 Adjoint and Inverse of a Matrix

In the previous chapter, we have studied inverse of a matrix. In this section, we shad discuss the condition of discuss the condition for existence of inverse of a matrix.

To find inverse of a matrix A, i.e., A⁻¹ we shall first define adjoint of a matrix.

Let

Hence

46.1 Adjoint of a matrix **2.6.1** The adjoint of a square matrix $A = [a_{ij}]_{n \times n}$ is defined as the transpose of the elements $A = [a_{ij}]_{n \times n}$ is defined as the transpose of permittion where A_{ij} is the cofactor of the element a_{ij} . Adjoint of the matrix Ais denoted by adj A.

$$\mathbf{A} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

Then
$$adj A = Transpose of \begin{bmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \\ A_{31} & A_{32} & A_{33} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{bmatrix}$$

Example 23 Find
$$adj$$
 A for A = $\begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}$

Solution We have $A_{11} = 4$, $A_{12} = -1$, $A_{21} = -3$, $A_{22} = 2$

$$adj A = \begin{bmatrix} A_{11} & A_{21} \\ A_{12} & A_{22} \end{bmatrix} = \begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix}$$

Remark For a square matrix of order 2, given by

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

The adj A can also be obtained by interchanging a_{11} and a_{22} and by changing signs of a_{12} and a_{21} , i.e..

$$adj A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{bmatrix}$$

Change sign Interchange

We state the following theorem without proof.

Theorem 1 If A be any given square matrix of order n, then

$$A(adj A) = (adj A) A = |A|I$$
,

where I is the identity matrix of order n

e shall

en by

= 22

18

Verification

Let
$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$
, then $adj A = \begin{bmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{bmatrix}$

Since sum of product of elements of a row (or a column) with corresponding cofactors is equal to |A| and otherwise zero, we have

$$A (adj A) = \begin{bmatrix} |A| & 0 & 0 \\ 0 & |A| & 0 \\ 0 & 0 & |A| \end{bmatrix} = |A| \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = |A| 1$$

Contacts we can show (id; A) A = A [

Hence A(ua) A = (ad) A = A T

" Unition 4

A square matrix A is said to be singular if |A| = 0.

For example, the determinant of matrix $A = \begin{bmatrix} 1 & 2 \\ 4 & 8 \end{bmatrix}$ is zero

Hence A is a singular matrix.

A square matrix A is said to be non-singular if $|A| \neq 0$

Let
$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$
. Then $|A| = \begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix} = 4 - 6 = -2 \neq 0$.

Hence A is a nonsingular matrix

We state the following theorems without proof.

If A and B are nonsingular matrices of the same order, then AB and BA are also nonsingular matrices of the same order.

The determinant of the product of matrices is equal to product of their respective determinants, that is, |AB| = |A| |B|, where A and B are square matrices of the same order

Remark
We know that
$$(adj A) A = |A| 1 = \begin{bmatrix} |A| & 0 & 0 \\ 0 & |A| & 0 \\ 0 & 0 & |A| \end{bmatrix}, |A| \neq 0$$

Writ

1.8.

Writing determinants of matrices on both sides, we have

$$\begin{vmatrix} (adj \mathbf{A}) \mathbf{A} \end{vmatrix} = \begin{vmatrix} |\mathbf{A}| & 0 & 0 \\ 0 & |\mathbf{A}| & 0 \\ 0 & 0 & |\mathbf{A}| \end{vmatrix}$$

$$|(adj \ A)| \ |A| = |A|^3 \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$
 (Why?)

 $|(adj A)| |A| = |A|^3 (1)$

i.e. $|(adj A)| = |A|^2$ In general, if A is a non singular matrix of order n, then $|adj(A)| = |A|^{n-1}$.

Theorem 4 A square matrix A is invertible if and only if A is nonsingular matrix.

Proof Let A be invertible matrix of order n and I be the identity matrix of order n.

Then, there exists a square matrix B of order n such that AB = BA = I

Then, there exists a square matrix B of order h such that
$$AB = BA - I$$

Now $AB = I$. So $|AB| = |I|$ or $|A| |B| = I$ (since $|I| = I$, $|AB| = |A| |B|$)

 $|A| \neq 0$. Hence A is nonsingular. This gives

Conversely, let A be nonsingular. Then $|A| \neq 0$

Now
$$A (adj A) = (adj A) A = |A| I$$
 (Theorem 1)

$$A\left(\frac{1}{|A|}adjA\right) = \left(\frac{1}{|A|}adjA\right)A = I$$

$$AB = BA = I$$
, where $B = \frac{1}{|A|} adj A$

A is invertible and
$$A^{-1} = \frac{1}{|A|} adj A$$

If
$$A = \begin{bmatrix} 1 & 3 & 3 \\ 1 & 4 & 3 \\ 1 & 3 & 4 \end{bmatrix}$$
, then verify that A adj $A = |A|$ I. Also find A^{-1} .

We have
$$|A| = 1(16-9) - 3(4-3) + 3(3-4) = 1 \neq 0$$

MATHEMATICS Now $A_{11} = 7$, $A_{12} = -1$, $A_{13} = -1$, $A_{21} = -3$, $A_{22} = 1$, $A_{23} = 0$, $A_{31} = -3$, $A_{12} = -3$

$$A_{33} = 1$$

Therefore

$$adj A = \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

Now

$$A (adj A) = \begin{bmatrix} 1 & 3 & 3 \\ 1 & 4 & 3 \\ 1 & 3 & 4 \end{bmatrix} \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 7-3-3 & -3+3+0 & -3+0+3 \\ 7-4-3 & -3+4+0 & -3+0+3 \\ 7-3-4 & -3+3+0 & -3+0+4 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = (1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = |A| \cdot I$$

Also
$$A^{-1} = \frac{1}{|A|} a dj A = \frac{1}{1} \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

Example 25 If $A = \begin{bmatrix} 2 & 3 \\ 1 & -4 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & -2 \\ -1 & 3 \end{bmatrix}$, then verify that $(AB)^{-1} = B^{-1}A^{-1}$.

Solution We have AB =
$$\begin{bmatrix} 2 & 3 \\ 1 & -4 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ -1 & 3 \end{bmatrix} = \begin{bmatrix} -1 & 5 \\ 5 & -14 \end{bmatrix}$$

Since, $|AB| = -11 \neq 0$, $(AB)^{-1}$ exists and is given by

$$(AB)^{-1} = \frac{1}{AB} adj (AB) = -\frac{1}{11} \begin{bmatrix} -14 & -5 \\ -5 & -1 \end{bmatrix} = \frac{1}{11} \begin{bmatrix} 14 & 5 \\ 5 & 1 \end{bmatrix}$$

Further, $A = -11 \neq 0$ and $B = 1 \neq 0$. Therefore, A^{-1} and B^{-1} both exist and are given by

$$A^{-1} = -\frac{1}{11}\begin{bmatrix} -4 & -3 \\ -1 & 2 \end{bmatrix}, B^{-1} = \begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}$$

Therefore
$$B^{-1}A^{-1} = -\frac{1}{11}\begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}\begin{bmatrix} -4 & -3 \\ -1 & 2 \end{bmatrix} = -\frac{1}{11}\begin{bmatrix} -14 & -5 \\ -5 & -1 \end{bmatrix} = \frac{1}{11}\begin{bmatrix} 14 & 5 \\ 5 & 1 \end{bmatrix}$$
Hence $(AB)^{-1} = B^{-1}A^{-1}$

TB92 V. IND Example 26 Show that the matrix $A = \begin{bmatrix} 2 & 3 \\ 1 & 2 \end{bmatrix}$ satisfies the equation $A^2 - 4A + I = O$, where I is 2×2 identity matrix and O is 2×2 zero matrix. Using this equation, find A^{-1} .

Solution We have
$$A^2 = A \cdot A = \begin{bmatrix} 2 & 3 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & 3 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 7 & 12 \\ 4 & 7 \end{bmatrix}$$

Hence
$$A^2 - 4A + I = \begin{bmatrix} 7 & 12 \\ 4 & 7 \end{bmatrix} - \begin{bmatrix} 8 & 12 \\ 4 & 8 \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

Now
$$A^2 - 4A + I = O$$

Therefore
$$AA - 4A = -I$$

or
$$A \cdot A \cdot A^{-1} = -I \cdot A^{-1}$$
 (Post multiplying by A^{-1} because $|A| \neq 0$)

or
$$A(AA^{-1}) - 4I = -A^{-1}$$

or
$$AI - 4I = -A^{-1}$$

or
$$A^{-1} = 4I - A = \begin{bmatrix} 4 & 0 \\ 0 & 4 \end{bmatrix} - \begin{bmatrix} 2 & 3 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 2 & -3 \\ -1 & 2 \end{bmatrix}$$

Hence
$$A^{-1} = \begin{bmatrix} 2 & -3 \\ -1 & 2 \end{bmatrix}$$

Applications of Determinants and Matrices

Application, we shall discuss application of determinants and matrices for solving the his section, the properties and matrices for solving the sem of linear equations. system of linear equations.

system A system of equations is said to be consistent if its solution (one

consistent system A system of equations is said to be inconsistent if its solution s not exist.

In this chapter, we restrict ourselves to the system of linear equations Note unique solutions only.

as express the system of finear equations as matrix equations and solve them using erse of the matrix.

Consider the system of equations

$$a_{1} x + b_{1} y + c_{1} z = d_{1}$$

$$a_{2} x + b_{2} y + c_{2} z = d_{2}$$

$$a_{3} x + b_{3} y + c_{3} z = d_{3}$$

$$A = \begin{bmatrix} a_{1} & b_{1} & c_{1} \\ a_{2} & b_{2} & c_{2} \\ a_{3} & b_{3} & c_{3} \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} d_{1} \\ d_{2} \\ d_{3} \end{bmatrix}$$

Then, the system of equations can be written as, AX = B, i.e.,

$$\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

f A is a nonsingular matrix, then its inverse exists. Now

$$AX = B$$

$$A^{-1} (AX) = A^{-1} B$$
 (premultiplying by A⁻¹)
$$(A^{-1}A) X = A^{-1} B$$
 (by associative property)
$$IX = A^{-1} B$$

$$X = A^{-1} B$$

matrix equation provides unique solution for the given system of equations as of a matrix is unique. This method of solving system of equations is known a Method.

MATHEMATICS South Case II If A is a singular matrix, then |A| = 0.

In this case, we calculate (adj A) B.

If $(adj A) B \neq O$, (O being zero matrix), then solution does not exist and the \mathfrak{g}_{h} of equations is called inconsistent.

If (adj A) B = O, then system may be either consistent or inconsistent accompany to the system of as the system have either infinitely many solutions or no solution.

Example 27 Solve the system of equations

$$2x + 5y = 1$$

$$3x + 2y = 7$$

Solution The system of equations can be written in the form AX = B, where

$$A = \begin{bmatrix} 2 & 5 \\ 3 & 2 \end{bmatrix}, X = \begin{bmatrix} x \\ y \end{bmatrix} \text{ and } B = \begin{bmatrix} 1 \\ 7 \end{bmatrix}$$

Now, $|A| = -11 \neq 0$, Hence, A is nonsingular matrix and so has a unique solution

Note that

500h

$$A^{-1} = -\frac{1}{11} \begin{bmatrix} 2 & -5 \\ -3 & 2 \end{bmatrix}$$

Therefore

$$X = A^{-1}B = -\frac{1}{11}\begin{bmatrix} 2 & -5 \\ -3 & 2 \end{bmatrix}\begin{bmatrix} 1 \\ 7 \end{bmatrix}$$

i.e.

$$\begin{bmatrix} x \\ y \end{bmatrix} = -\frac{1}{11} \begin{bmatrix} -33 \\ 11 \end{bmatrix} = \begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

Hence

$$x = 3, y = -1$$

Example 28 Solve the following system of equations by matrix method.

P056

$$3x - 2y + 3z = 8$$

$$2x + y - z = 1$$

$$4x - 3y + 2z = 4$$

Solution The system of equations can be written in the form AX = B, where

$$A = \begin{bmatrix} 3 & -2 & 3 \\ 2 & 1 & -1 \\ 4 & -3 & 2 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} 8 \\ 1 \\ 4 \end{bmatrix}$$

We see that

$$|A| = 3(2-3) + 2(4+4) + 3(-6-4) = -17 \neq 0$$

Hence A is no

Therefore

This sy

Here

second number to it, we get 11. By adding first and third numbers, we get double of the second number. Represent it algebraically and find the numbers using matrix method.

SolutionLet first, second and third numbers be denoted by x, y and z, respectively. Then, according to given conditions, we have

$$x + y + z = 6$$

$$y + 3z = 11$$

$$x + z = 2y \text{ or } x - 2y + z = 0$$

This system can be written as A X = B, where

d the sys

it accord

ere

ution.

$$\mathbf{A} = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 3 \\ 1 & -2 & 1 \end{bmatrix}, \mathbf{X} = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } \mathbf{B} = \begin{bmatrix} 6 \\ 11 \\ 0 \end{bmatrix}$$

Here $|A| = 1(1+6) - (0-3) + (0-1) = 9 \neq 0$. Now we find adj A $A_{11} = 1 (1 + 6) = 7,$ $A_{12} = -(0 - 3) = 3,$ $A_{13} = -1$ $A_{21} = -(1 + 2) = -3,$ $A_{22} = 0,$ $A_{23} = -(-2 - 1) = 3$ $A_{31} = (3 - 1) = 2,$ $A_{32} = -(3 - 0) = -3,$ $A_{33} = (1 - 0) = 1$

MATHEMATICS 136

$$adj A = \begin{bmatrix} 7 & -3 & 2 \\ 3 & 0 & -3 \\ -1 & 3 & 1 \end{bmatrix}$$

Hence

Thus

$$A^{-1} = \frac{1}{|A|} adj (A) = \frac{1}{9} \begin{bmatrix} 7 & -3 & 2 \\ 3 & 0 & -3 \\ -1 & 3 & 1 \end{bmatrix}$$

Since

$$X = A^{-1} B$$

$$X = \frac{1}{9} \begin{bmatrix} 7 & -3 & 2 \\ 3 & 0 & -3 \\ -1 & 3 & 1 \end{bmatrix} \begin{bmatrix} 6 \\ 11 \\ 0 \end{bmatrix}$$

or

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{9} \begin{bmatrix} 42 - 33 + 0 \\ 18 + 0 + 0 \\ -6 + 33 + 0 \end{bmatrix} = \frac{1}{9} \begin{bmatrix} 9 \\ 18 \\ 27 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

Thus

x = 1, y = 2, z = 3

Examine the consistency of the system of equations in Exercises 1 to 6.

4.
$$x - y + 2z = 1$$

$$x - 2y + z = -4$$

$$3x + 4y - 5z = -$$

$$3x - y - 2z = 3$$

$$2x - y + 3z = 12$$

$$\int_{A} \int_{A}^{A} A = \begin{bmatrix} 2 & -3 & 5 \\ 3 & 2 & -4 \\ 1 & 1 & -2 \end{bmatrix}, \text{ find } A^{-1}. \text{ Using } A^{-1} \text{ solve the system of equations}$$

$$2x - 3y + 5z = 11$$

$$3x + 2y - 4z = -5$$

$$x + y - 2z = -3$$

The cost of 4 kg onion, 3 kg wheat and 2 kg rice is Rs 60. The cost of 2 kg onion, 4kg wheat and 6 kg rice is Rs 90. The cost of 6 kg onion 2 kg wheat and 3 kg gice is Rs 70. Find cost of each item per kg by matrix method.

Miscellaneous Examples

If a, b, c are positive and unequal, show that value of the determinant

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$
 is negative.

Letion Applying $C_1 \rightarrow C_1 + C_2 + C_3$ to the given determinant, we get

$$\Delta = \begin{vmatrix} a+b+c & b & c \\ a+b+c & c & a \\ a+b+c & a & b \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix}$$

$$= (a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & c - b & a - c \\ 0 & a - b & b - c \end{vmatrix}$$
 (Applying $R_2 \rightarrow R_2 - R_1$, and $R_3 \rightarrow R_3 - R_1$)

$$= (a + b + c) [(c - b) (b - c) - (a - c) (a - b)]$$
 (Expanding along C₁)

$$= (a + b + c)(-a^2 - b^2 - c^2 + ab + bc + ca)$$

$$= \frac{-1}{2} (a + b + c) (2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ca)$$

$$= \frac{-1}{2} (a + b + c) [(a - b)^2 + (b - c)^2 + (c - a)^2]$$

$$= \frac{-1}{2} (a + b + c) [(a - b)^2 + (b - c)^2 + (c - a)^2]$$

$$= \frac{-1}{2} (a + b + c) [(a - b)^2 + (b - c)^2 + (c - a)^2]$$

$$= \frac{-1}{2} (a + b + c) [(a - b)^2 + (b - c)^2 + (c - a)^2]$$

$$= \frac{-1}{2} (a + b + c) [(a - b)^2 + (b - c)^2 + (c - a)^2]$$

MATHEMATICS

Example 31 If a, b, c, are in A.P, find value of

Example 31 If
$$a, b, c$$
, are in A.P., find value of $\begin{vmatrix} 2y+4 & 5y+7 & 8y+a \\ 3y+5 & 6y+8 & 9y+b \\ 4y+6 & 7y+9 & 10y+c \end{vmatrix}$

SolutionApplying $R_1 \rightarrow R_1 + R_3 - 2R_2$ to the given determinant, we obtain

$$\begin{vmatrix} 0 & 0 & 0 \\ 3y+5 & 6y+8 & 9y+b \\ 4y+6 & 7y+9 & 10y+c \end{vmatrix} = 0 \quad \text{(Since } 2b = a+c)$$

$$\Delta = \begin{vmatrix} 0 & 0 & 0 \\ 3y + 5 & 6y + 8 & 9y + b \\ 4y + 6 & 7y + 9 & 10y + c \end{vmatrix} = 0 \quad \text{(Since } 2b = a + c)$$

$$\Delta = \begin{vmatrix} (y + z)^2 & xy & zx \\ xy & (x + z)^2 & yz \\ xz & yz & (x + y)^2 \end{vmatrix} = 2xyz (x + y + z)^3$$

$$\Delta = \begin{vmatrix} xy & (x + z)^2 & yz \\ xz & yz & (x + y)^2 \end{vmatrix} = 2xyz (x + y + z)^3$$

SolutionApplying $R_1 \rightarrow xR_1$, $R_2 \rightarrow yR_2$, $R_3 \rightarrow zR_3$ to Δ and dividing by xyz, we get

$$\Delta = \frac{1}{xyz} \begin{vmatrix} x(y+z)^2 & x^2y & x^2z \\ xy^2 & y(x+z)^2 & y^2z \\ xz^2 & yz^2 & z(x+y)^2 \end{vmatrix}$$

Taking common factors x, y, z from C_1 C_2 and C_3 , respectively, we get

$$\Delta = \frac{xyz}{xyz} \begin{vmatrix} (y+z)^2 & x^2 & x^2 \\ y^2 & (x+z)^2 & y^2 \\ z^2 & z^2 & (x+y)^2 \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - C_1$, $C_3 \rightarrow C_3 - C_1$, we have

$$\Delta = \begin{vmatrix} (y+z)^2 & x^2 - (y+z)^2 & x^2 - (y+z)^2 \\ y^2 & (x+z)^2 - y^2 & 0 \\ z^2 & 0 & (x+y)^2 - z^2 \end{vmatrix}$$

Taking com

Applying

Finally 6

Soluti

Ptain

y xyz, we get

Taking common factor
$$(x + y + z)$$
 from C_2 and C_3 , we have
$$\Delta = (x + y + z)^2 \begin{vmatrix} (y+z)^2 & x - (y+z) & x - (y+z) \\ y^2 & (x+z) - y & 0 \\ z^2 & 0 & (x+y) - z \end{vmatrix}$$

Applying $R_1 \rightarrow R_1 - (R_2 + R_3)$, we have

$$\Delta = (x + y + z)^{2} \begin{vmatrix} 2yz & -2z & -2y \\ y^{2} & x - y + z & 0 \\ z^{2} & 0 & x + y - z \end{vmatrix}$$

Applying $C_2 \to (C_2 + \frac{1}{y} C_1)$ and $C_3 \to \left(C_3 + \frac{1}{z} C_1\right)$, we get

$$\Delta = (x + y + z)^{2}$$

$$\begin{vmatrix} 2yz & 0 & 0 \\ y^{2} & x+z & \frac{y^{2}}{z} \\ z^{2} & \frac{z^{2}}{y} & x+y \end{vmatrix}$$

Finally expanding along R₁, we have

$$\Delta = (x + y + z)^2 (2yz) [(x + z) (x + y) - yz] = (x + y + z)^2 (2yz) (x^2 + xy + xz)$$
$$= (x + y + z)^3 (2xyz)$$

$$x - y + 2z = 1$$

$$2y - 3z = 1$$

$$3x - 2y + 4z = 2$$

Consider the product $\begin{bmatrix} 1 & -1 & 2 \\ 0 & 2 & -3 \\ 3 & -2 & 4 \end{bmatrix} \begin{bmatrix} -2 & 0 & 1 \\ 9 & 2 & -3 \\ 6 & 1 & -2 \end{bmatrix}$

EMATICS
$$\begin{bmatrix}
-2 - 9 + 12 & 0 - 2 + 2 & 1 + 3 - 4 \\
0 + 18 - 18 & 0 + 4 - 3 & 0 - 6 + 6 \\
-6 - 18 + 24 & 0 - 4 + 4 & 3 + 6 - 8
\end{bmatrix} = \begin{bmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{bmatrix}$$

Hence

$$\begin{bmatrix} 1 & -1 & 2 \\ 0 & 2 & -3 \\ 3 & -2 & 4 \end{bmatrix} = \begin{bmatrix} -2 & 0 & 1 \\ 9 & 2 & -3 \\ 6 & 1 & -2 \end{bmatrix}$$

Now, given system of equations can be written, in matrix form, as follows

$$\begin{bmatrix} 1 & -1 & 2 \\ 0 & 2 & -3 \\ 3 & -2 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$$

or

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 & -1 & 2 \\ 0 & 2 & -3 \\ 3 & -2 & 4 \end{bmatrix}^{-1} \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 & 1 \\ 9 & 2 & -3 \\ 6 & 1 & -2 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$$

$$= \begin{bmatrix} -2+0+2 \\ 9+2-6 \\ 6+1-4 \end{bmatrix} = \begin{bmatrix} 0 \\ 5 \\ 3 \end{bmatrix}$$

 $x = 0, y = 5 \text{ and } z = 3$

Hence

Example 34Prove that

$$\Delta = \begin{vmatrix} a+bx & c+dx & p+qx \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix} = (1-x^2) \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$$

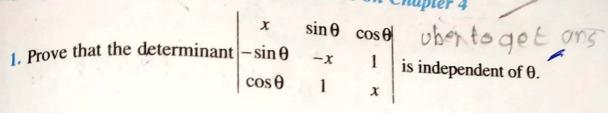

SolutionApplying $R_1 \rightarrow R_1 - x R_2$ to Δ , we get

$$\Delta = \begin{vmatrix} a(1-x^2) & c(1-x^2) & p(1-x^2) \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix}$$

 $= (1-x^2) \begin{vmatrix} a & c & p \\ ax+b & cx+d & rx+d \end{vmatrix}$

Applying
$$R_2 \to R_2 - x R_1$$
, we get
$$\Delta = (1 - x^2) \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$$

Miscellaneous Exercises on Chapter 4

2. Without expanding the determinant, prove that
$$\begin{vmatrix} a & a^2 & bc \\ b & b^2 & ca \\ c & c^2 & ab \end{vmatrix} = \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix}$$
.

3. Evaluate
$$\begin{vmatrix} \cos\alpha \cos\beta & \cos\alpha \sin\beta & -\sin\alpha \\ -\sin\beta & \cos\beta & 0 \\ \sin\alpha \cos\beta & \sin\alpha \sin\beta & \cos\alpha \end{vmatrix}$$

4. If a, b and c are real numbers, and

$$\Delta = \begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix} = 0,$$

Show that either a + b + c = 0 or a = b = c.

5. Solve the equation
$$\begin{vmatrix} x+a & x & x \\ x & x+a & x \\ x & x & x+a \end{vmatrix} = 0, a \neq 0$$
 $\Re z \stackrel{\text{cd}}{=} 3$

6 Prove that
$$\begin{vmatrix} a^2 & bc & ac+c^2 \\ a^2+ab & b^2 & ac \\ ab & b^2+bc & c^2 \end{vmatrix} = 4a^2b^2c^2$$

8. Let
$$A = \begin{bmatrix} 1 & -2 & 1 \\ -2 & 3 & 1 \\ 1 & 1 & 5 \end{bmatrix}$$
. Verify that

(i)
$$[adj \ A]^{-1} = adj \ (A^{-1})$$
 (ii) $(A^{-1})^{-1} = A$

(ii)
$$(A^{-1})^{-1} = A$$

9. Evaluate
$$\begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$$
 Noto 3

$$|x+y|, x = y = |y| = |$$

Using properties of determinants in Exercises 11 to 15, prove that:

11.
$$\begin{vmatrix} \alpha & \alpha^2 & \beta + \gamma \\ \beta & \beta^2 & \gamma + \alpha \end{vmatrix} = (\beta - \gamma) (\gamma - \alpha) (\alpha - \beta) (\alpha + \beta + \gamma)$$

$$\gamma & \gamma^2 & \alpha + \beta \end{vmatrix}$$

$$\begin{vmatrix} x & x^{2} & 1 + px^{3} \\ y & y^{2} & 1 + py^{3} \\ z & z^{2} & 1 + pz^{3} \end{vmatrix} = \underbrace{(1 + pxyz)(x - y)(y - z)(z - x)}_{1}$$

13.
$$\begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix} = 3(a+b+c)(ab+bc+ca)$$

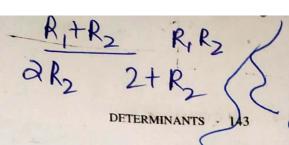

$$\begin{vmatrix} 1 & 1+p & 1+p+q \\ 2 & 3+2p & 4+3p+2q \\ 3 & 6+3p & 10+6p+3q \end{vmatrix} = 1$$

$$\begin{vmatrix} \sin \alpha & \cos \alpha & \cos(\alpha+\delta) \\ \sin \beta & \cos \beta & \cos(\beta+\delta) \\ \sin \gamma & \cos \gamma & \cos(\gamma+\delta) \end{vmatrix} = 0$$
Solve the system of the continuous formula in the c

$$\begin{vmatrix}
\sin \alpha & \cos \alpha & \cos(\alpha + \delta) \\
\sin \beta & \cos \beta & \cos(\beta + \delta)
\end{vmatrix} = 0$$

16. Solve the sys em of the following equations

$$\frac{2}{x} + \frac{3}{y} + \frac{10}{z} = 4$$

$$\frac{4}{x} - \frac{6}{y} + \frac{5}{z} = 1$$

$$\frac{6}{x} + \frac{9}{y} - \frac{20}{z} = 2$$

the correct answer in Exercise 17 to 19.

If a, b, c, are in A.P, then the determinant

$$\begin{vmatrix} x+2 & x+3 & x+2a \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix}$$
 is

$$(D)$$
 $2x$

7)+2(0,0) 33 - L3 13

18. If x, y, z are nonzero real numbers, then the inverse of matrix $A = \begin{bmatrix} x & 0 & 0 \\ 0 & y & 0 \\ 0 & 0 & z \end{bmatrix}$ is

(A)
$$\begin{bmatrix} x^{-1} & 0 & 0 \\ 0 & y^{-1} & 0 \\ 0 & 0 & z^{-1} \end{bmatrix}$$

(B)
$$xyz\begin{bmatrix} x^{-1} & 0 & 0 \\ 0 & y^{-1} & 0 \\ 0 & 0 & z^{-1} \end{bmatrix}$$

$$\begin{bmatrix} (C) & \frac{1}{xyz} \begin{bmatrix} x & 0 & 0 \\ 0 & y & 0 \\ 0 & 0 & z \end{bmatrix}$$

(D)
$$\frac{1}{xyz} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Let
$$A = \begin{bmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{bmatrix}$$
, where $0 \le \theta \le 2\pi$. Then

(A)
$$Det(A) = 0$$

(C)
$$Det(A) \in (2, 4)$$

(B)
$$Det(A) \in (2, \infty)$$

(D)
$$Det(A) \in [2, 4]$$

- Determinant of a matrix $A = [a_{11}]_{1\times 1}$ is given by $|a_{11}| = a_{11}$
- Determinant of a matrix $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ is given by

$$|A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11} a_{22} - a_{12} a_{21}$$

Determinant of a matrix $A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$ is given by (expanding along R_1)

$$|\mathbf{A}| = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - b_1 \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} + c_1 \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}$$

For any square matrix A, the |A| satisfy following properties.

- |A'| = |A|, where A' = transpose of A.
- If we interchange any two rows (or columns), then sign of determinant changes.
- If any two rows or any two columns are identical or proportional, then value of determinant is zero.
- If we multiply each element of a row or a column of a determinant by constant k, then value of determinant is multiplied by k.
- Multiplying a determinant by k means multiply elements of only one row (or one column) by k.
- If $A = [a_{ij}]_{3\times 3}$, then $|k.A| = k^3 |A|$
- If elements of a row or a column in a determinant can be expressed as sum of two or more elements, then the given determinant can be expressed as sum of two or more determinants.

If to each element of a row or a column of a data scar

Area of a triangle with (x_1, y_1) , (x_2, y_2) and (x_3, y_3) is given by

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Minor of an element a_{ij} of the determinant of matrix A is the determinant minor of an element a_{ij} of the determinant of matrix A is the determinant of the Minor of all clothed j^{th} row and j^{th} column and denoted by M_{ij} obtained by deleting i^{th} row and j^{th} column and denoted by M_{ij}

Cofactor of a_{ij} of given by $A_{ij} = (-1)^{i+j} M_{ij}$

Value of determinant of a matrix A is obtained by sum of product of elements Value of a column) with corresponding cofactors. For example,

$$|\mathbf{A}| = a_{11} \mathbf{A}_{11} + a_{12} \mathbf{A}_{12} + a_{13} \mathbf{A}_{13}$$

If elements of one row (or column) are multiplied with cofactors of elements of any other row (or column), then their sum is zero. of any other row (or column), then their sum is zero. For example, $a_{11} A_{21} + a_{12}$

If
$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$
, then $adj A = \begin{bmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{bmatrix}$, where A_{ij} is

cofactor of aii

- A(adj A) = (adj A) A = |A| I, where A is square matrix of order n.
- A square matrix A is said to be singular or non-singular according as $|A| = 0 \text{ or } |A| \neq 0.$
- If AB = BA = I, where B is square matrix, then B is called inverse of A. Also $A^{-1} = B$ or $B^{-1} = A$ and hence $(A^{-1})^{-1} = A$.
- A square matrix A has inverse if and only if A is non-singular. $|A| \neq 0$

$$A^{-1} = \frac{1}{|A|} (adj A)$$

If
$$a_1x + b_1y + c_1z = d_1$$

 $a_2x + b_2y + c_2z = d_2$
 $a_3x + b_3y + c_3z = d_3$,

then these equations can be written as A X = B, where

$$A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

MATHEMATICS (adjA) B=0 (adjA) B=0 $A \times A$ Consistent according as its an inconsistent according as its analysis. 146

Unique solution of equation A system of equation is consistent or inconsistent according as its solution

For a square matrix A in matrix equation AX = B

(i) $|A| \neq 0$, there exists unique solution

(ii) |A| = 0 and $(adj A) B \neq 0$, then there exists no solution

(iii) |A| = 0 and (adj A) B = 0, then system may or may not be consistent

Historical Note

The Chinese method of representing the coefficients of the unknowns of several linear equations by using rods on a calculating board naturally led to the discovery of simple method of elimination. The arrangement of rods was precisely that of the numbers in a determinant. The Chinese, therefore, early developed the idea of subtracting columns and rows as in simplification of a determinant

Seki Kowa, the greatest of the Japanese Mathematicians of seventeenth century in his work 'Kai Fukudai no Ho' in 1683 showed that he had the idea of determinants and of their expansion. But he used this device only in eliminating a quantity from two equations and not directly in the solution of a set of simultaneous linear equations. 'T. Hayashi, "The Fakudoi and Determinants in Japanese Mathematics," in the proc. of the Tokyo Math. Soc., V.

Vendermonde was the first to recognise determinants as independent functions. He may be called the formal founder. Laplace (1772), gave general method of expanding a determinant in terms of its complementary minors. In 1773 Lagrange treated determinants of the second and third orders and used them for purpose other than the solution of equations. In 1801, Gauss used determinants in his

The next great contributor was Jacques - Philippe - Marie Binet, (1812) who stated the theorem relating to the product of two matrices of m-columns and nrows, which for the special case of m = n reduces to the multiplication theorem.

Also on the same day, Cauchy (1812) presented one on the same subject. He used the word 'determinant' in its present sense. He gave the proof of multiplication

The greatest contributor to the theory was Carl Gustav Jacob Jacobi, after the word data and cam Scanner this the word determinant received its final Scanned with CamScanner
